

The Long (Self-)Correction

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

****Claim****

The Long Self-Correction is proposed as a more pragmatic approach than AI Pause and Long Reflection for addressing the inherent risks posed by human involvement in AI development.

****Evidence****

The proposal critiques the AI Pause for lacking a clear endpoint and purpose, highlighting that human capabilities to oversee AI systems are fundamentally flawed. It suggests that the Long Reflection fails to address the deeper issues with human decision-making and oversight.

****Method****

The concept is presented as a theoretical framework rather than through empirical testing or experimental validation, relying on philosophical reasoning around human capability and safety.

****Limitations****

The proposal does not provide empirical evidence or case studies to support its claims and relies heavily on theoretical assumptions about human cognition and oversight capabilities.

****Safety relevance****

This concept challenges existing frameworks for thinking about AI alignment and underscores the need for more fundamental changes in our understanding of human roles in AI development.
