

The Long (Self-)Correction

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

****Claim****

The Long Self-Correction offers a more practical framework for addressing AI safety than the concepts of AI Pause and Long Reflection.

****Evidence****

The proposal critiques existing concepts by highlighting the inadequacies of human oversight and the potential for unsafe development practices. It suggests that merely pausing or reflecting does not address the underlying issues of human unpreparedness and safety.

****Method****

The argument is presented as a conceptual analysis rather than empirical research, relying on philosophical reasoning and critiques of existing proposals.

****Limitations****

The lack of empirical data or case studies to support the claims limits the robustness of the argument. The conceptual nature of the proposal may not provide actionable steps for immediate implementation.

****Safety relevance****

This perspective shifts the focus towards improving human capability and safety in the context of AI development and oversight, rather than solely on the AI systems themselves.
