

Value Generalisation 3: Pre-aligned AIs

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

****Claim****

The development of pre-aligned AIs that exhibit strong generalization capabilities could mitigate the conflict between alignment and capabilities.

****Evidence****

The discussion references previous posts that outline the potential for strong generalization, though specific empirical studies or experiments are not detailed in the summary. It emphasizes a conceptual framework rather than providing quantitative data.

****Method****

The work appears to be conceptual, building on previous discussions rather than presenting new experimental results or methodologies. There is no specific evaluation setup or datasets mentioned.

****Limitations****

The claims are largely aspirational and lack empirical validation, which raises questions about the feasibility of achieving pre-aligned AIs. The evidence for strong generalization is not substantiated with rigorous experiments or data.

****Safety relevance****

This perspective highlights the ongoing challenge of balancing AI alignment and capabilities, suggesting that successful generalization could change the landscape of AI safety.

Full Announcement Details

The development of pre-aligned AIs that exhibit strong generalization capabilities could mitigate the conflict between alignment and capabilities. The discussion references previous posts that outline the potential for strong generalization, though specific empirical studies or experiments are not detailed in the summary. It emphasizes a conceptual framework rather than providing quantitative data.
